

Dear Reader,

**Mixon Vision an innovative product**

During the Ligna in Hanover this year we presented our last innovation, Mixon Vision.

A complete camera system controlled by smart software, which fast and adequately can measure applied adhesive applications.

The algorithms in the software compares, fast as lightning, the applied adhesive against a perfect reference application.

The machine operator now has the support tools to judge each single applied glue string.

A traffic light system will indicate all performance between “approved” via “watch-out” to “not approved”.

**What’s the trigger?**

Day-in, day-out production environments produce approved and non-approved products.

This last category is costly. Each single production batch which can be transformed from not-approved to approved, will cut the waste. These waste costs are normally all from a few percent (very good production) to 10-15% (normal production).

Our Mixon Vision system can help you simply to improve your production performance, by less waste!

**Attractive solution, at attractive pricing.**

The Mixon Vision system is now available at a complete price of € 15.000. We will supply a complete system; we will not use the approach of “a basic model and then add-on price by extra required features”. Everything is included!

Imagine yourself to decrease your waste by one percent per year. Calculate what this will give you in value at the bottom line.

We estimate that the investment for the Mixon Vision will give a surprisingly short return of investment.

**What kind of application?**

When you work with an industrial adhesive application moment in your production, we most likely can meet with Mixon Vision the quality control of performance.

Try us! Please contact Mixon to find out more about this!
